

CIT 3405: Digital Forensics Forensics Midterm

The midterm is open book/notes but closed neighbors. Please do your own work and do not share your answers with others! No AI use is allowed! You will use Autopsy with a downloaded image file very similar to past assignments. If you have questions, come to office hours 4-5 PM on Sunday nights.

0. Download [this image file](#) and open it in Autopsy (add data source Disk Image) on your own computer to find the following (10 pts each):

1. A deleted image file. Save it and insert the image file under here.

2. An email message in a text file. Find the IP address in its header and look up the location of the IP address (<https://www.whatismyip.com/ip-whois-lookup/>) and type or snip the location in here.

Organisation: Mailgun technologies inc.

Org ID: MP-757

**ADDRESS:112 E pecan st
state:TX**

Country: us

3. A file with the wrong extension. Save it. Give it the right extension according to its file header ([SANS hex_file_and_regex_cheat_sheet.pdf](#)), make sure it opens, and insert it here.

4. Text typed in and hidden inside a corrupt file. Find the 1 line of text hidden in the corrupt file and type or snip it in here.

x00000c70: FF D8 FF E0 00 10 4A 46 49 46 00 01 01 00 00 01JFIF.....

5. Image hidden inside the same corrupt file. You will have to use file carving to find the image inside the corrupted file. Extract the file and open it in the HxD editor. Look for the hex file header for a jpg image (use resource links above) and delete the hex code before the file header to the top. Save with the right extension, make sure it opens, and then insert it here. If you can't find it, show screenshots of what you tried for partial credit.

I try to carve but not open.

Turn in the link to your copy of this document with your screenshots on Moodle.
